

Chapter 1: NetPower Waveform Overview

What is NetPower Waveform?

NetPower Waveform is the PowerNet Software application that allows you to capture, upload, and display a graphical representation of waveform data from IMPACC metering and circuit breaker devices.

How is NetPower Waveform Used with PowerNet Software?

NetPower Waveform uploads and plots the data that has been collected from IMPACC metering and circuit breaker devices onto a graph so that you can more easily view and analyze the data.

By viewing the waveform data, you can see the harmonics that are present throughout the distribution system, as well as the magnitudes, dates, and times of power sags and swells.
